This document is incomplete. The external file associated with the glossary ‘abbreviations’ (which should be called `output.gls-abr`) hasn’t been created.

Check the contents of the file `output.glo-abr`. If it’s empty, that means you haven’t indexed any of your entries in this glossary (using commands like

`\gls` or `\glsadd`) so this list can’t be generated. If the file isn’t empty, the document build process hasn’t been completed.

Try one of the following:

- Add `automake` to your package option list when you load `glossaries-extra.sty`. For example:

```
\usepackage[automake]{glossaries-extra}
```

- Run the external (Lua) application:  
`makeglossaries-lite.lua "output"`
- Run the external (Perl) application:  
`makeglossaries "output"`

Then rerun  $\LaTeX$  on this document.

This message will be removed once the problem has been fixed.

## Introduction

### 1.1 put section name here

Write your text without any further commands, like this:.... Any organised system requires energy, be it a machine of some kind or a live organism. Energy is needed to win the uphill battle against entropy and pull together lifeless molecules to be able to do something in this world, like complete a PhD.

#### 1.1.1 Name your subsection

Different organised systems have different energy currencies. The machines that enable us to do science like sizzling electricity but at a controlled voltage<sup>1</sup>. Earth's living beings are no different, except that they have developed another preference. They thrive on various chemicals.

Most organisms use polymers of glucose units for energy storage and differ only slightly in the way they link together monomers to sometimes gigantic macromolecules. Dextran of bacteria is made from long chains of  $\alpha$ -1,6-linked glucose units.

Starch of plants and glycogen of animals consists of  $\alpha$ -1,4-glycosidic glucose polymers [1]. See figure 1.1 for a comparison of glucose polymer structure and chemistry.

Two references can be placed separated by a comma [1, 2].

Insulin stimulates the following processes:

- muscle and fat cells remove glucose from the blood,
- cells breakdown glucose via glycolysis and the citrate cycle, storing its energy in the form of ATP,
- liver and muscle store glucose as glycogen as a short-term energy reserve,
- adipose tissue stores glucose as fat for long-term energy reserve, and

## 2.2 Some math

**Theorem 1 (Residue Theorem)** *Let  $f$  be analytic in the region  $G$  except for the isolated singularities  $a_1, a_2, \dots, a_m$ . If  $\gamma$  is a closed rectifiable curve in  $G$  which does not pass through any of the points  $a_k$  and if  $\gamma \approx 0$  in  $G$ , then*

$$\frac{1}{2\pi i} \int_{\gamma} f = \sum_{k=1}^m n(\gamma; a_k) \text{Res}(f; a_k).$$

### 2.2.1 More math

$y = \sin(x)$ :

$$y = \int_0^x \cos(x) dx = \frac{e^{ix} - e^{-ix}}{2i} \tag{2.1}$$
